

# Follow-up in testicular cancer

Expert: **Prof Giuseppe Banna**, Candiolo Cancer Institute, FPO-IRCCS, Candiolo, Turin, Italy; Portsmouth Hospitals University NHS Trust, Portsmouth, United Kingdom

Discussant: **Dr Berardino De Bari**, Réseau Hospitalier Neuchâtelois, La Chaux-de-Fonds, Switzerland

## Extract from the e-ESO policy

The website contains presentations aimed at providing new knowledge and competences, and is intended as an informational and educational tool mainly designed for oncology professionals and other physicians interested in oncology.

These materials remain property of the authors or ESO respectively.

ESO is not responsible for any injury and/or damage to persons or property as a matter of a products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions or ideas contained in the material published in these presentations. Because of the rapid advances in medical sciences, we recommend that independent verification of diagnoses and drugs dosages should be made. Furthermore, patients and the general public visiting the website should always seek professional medical advice.

Finally, please note that ESO does not endorse any opinions expressed in the presentations.

## Disclosures

- Consulting fees: Astrazeneca
- Payment or honoraria for lectures or educational events: Astrazeneca, Astellas
- None related to this presentation

# Testicular cancer: facts and figures

- The most common malignancy in **young males**, between **16 and 34 years** (increasing incidence)
- About **50% seminomas**
- **80-85% stage I** disease
- The paradigm of a **curable neoplasm**
- Almost all patients become **long-term survivors**
- **Relapses** and **long-term effects** of treatments are of upmost importance for the **follow-up**

# Outline

- Relapse risk
- Treatment-related long-term effects
- Surveillance and follow-up recommendations
- Management of treatment-related effects

# Risk of relapse in early stage disease

| Stage and histology              | Risk factor (RF)   | Risk of relapse   | Cure rate         | References   |
|----------------------------------|--|---|-------------------|--|
| <b>Stage I Seminoma</b>          | <b><i>Tumor size (?)</i></b><br><b><i>Rete testis invasion (?)</i></b> | After #1 Carbo AUC7: 4-5%<br>Surveillance: 15-20%<br>- without RFs: 4-6%<br>- 1-2 RFs: 15.9-31%<br>Usually within 3 years | <b>≥ 99%</b>      | <i>Warde et al J Clin Oncol 2002</i><br><i>Mortensen et al Eur Urol 2014</i><br><i>Tandstad et al Ann Oncol 2016</i><br><i>Zengerling et al Urol Oncol 2018</i><br><i>Boormans et al Eur Urol 2018</i> |
| <b>Stage I Non-seminoma</b>      | <b>Vascular invasion (VI)</b><br><b>Embryonal carcinoma</b>            | After #1 BEP (or RPLND): <5%<br>Surveillance: ≈ 30%<br>- VI (-): 15%<br>- VI (+): 50%                                     | <b>≈ 99%</b>      | <i>Albers et al J Clin Oncol 2003</i><br><i>Nicolai N et al Eur Urol 2010</i><br><i>Cohn-Cedermark et al Andrology 2014</i>  |
| <b>Stage II A/B Seminoma</b>     | <b>LN size (2 cm) and no.</b>  | - RT or #3 BEP: 5%  | <b>&gt;97-98%</b> | <i>Giannatempo et al Ann Oncol 2015</i>  |
| <b>Stage II A/B Non-seminoma</b> | <b>Serum markers (m)</b>   | - RPLND/#2BEP or #3-4 BEP: 7-11%<br>- If m-, Surveillance (or RPLND): 10%<br>- If m+: #3-4 BEP: 11%                       | <b>≈ 97-98%</b>   | <i>Weissbach et al Eur Urol 2000</i>   |

# Prognosis has improved in stage IIC/III

*Analysis on 12,135 pts, 9,677 Non-Se and 2,458 Se, treated with platinum-based CT between 1990-2013*

| S<br>e<br>m<br>i<br>n<br>o<br>m<br>a                | Good Prognosis   | Intermediate Prognosis  | Poor Prognosis   |

*Analysis on 5202 non-Se and 660 Se pts treated with platinum-based CT between 1975-1990  
IGCCCG, JCO 1997*

## Risk factors:

- Histology (non-seminoma)
- Primary site (extragonadal/mediastinal)
- Visceral non-pulmonary metastases
- Serum tumour markers (STMs) levels

Gillesen et al J Clin Oncol 2021

| IGCCCG  | 5-year PFS 1997   | 5-year PFS Update | 5-year OS 1997    | 5-year OS Update  |
|---------|-------------------|-------------------|-------------------|-------------------|

*9,531 pts to update IGCCCG estimates on contemporary data  
4,903 pts to build and validated new prognostic model*

# Prognosis in relapsed/refractory disease

**The International Prognostic Study Group (IPSG) score on analysis on 1,984 patients with GCT who progressed after at least 3 cisplatin-based cycles and were treated with cisplatin-based conventional-dose or carboplatin-based high-dose salvage chemotherapy**

**Table 4.** Prognostic Score for Patients With Nonseminoma and Seminoma

| Parameter   | Score Points |              |         |                         | Score |
|---|--------------|--------------|---------|-------------------------|-------|
|   | 0            | 1            | 2       | 3                       |       |
| Primary site  | Gonadal      | Extragenital | —       | Mediastinal nonseminoma |       |
| Prior response  | CR/PRm—      | PRm+/SD      | PD      | —                       |       |
| PFI, months   | > 3          | ≤ 3          | —       | —                       |       |
| AFP salvage   | Normal       | ≤ 1,000      | > 1,000 | —                       |       |
| HCG salvage   | ≤ 1,000      | > 1,000      | —       | —                       |       |
| LBB   | No           | Yes          | —       | —                       |       |
| Score sum (values from 0 to 10)   |              |              |         |                         |       |
| Regroup score sum into categories: (0) = 0; (1 or 2) = 1; (3 or 4) = 2; (5 or more) = 3                             |              |              |         |                         |       |
| Add histology score points: pure seminoma = −1; nonseminoma or mixed tumors = 0                                     |              |              |         |                         |       |
| Final prognostic score (−1 = very low risk; 0 = low risk; 1 = intermediate risk; 2 = high risk; 3 = very high risk) |              |              |         |                         |       |

Abbreviations: CR, complete remission; PRm—, partial remission, negative markers; PRm+, partial remission, positive markers; SD, stable disease; PD, progressive disease; PFI, progression-free interval; AFP, alpha fetoprotein; HCG, human chorionic gonadotrophin; LBB, liver, bone, brain metastases.

# Late relapses – Indiana University series

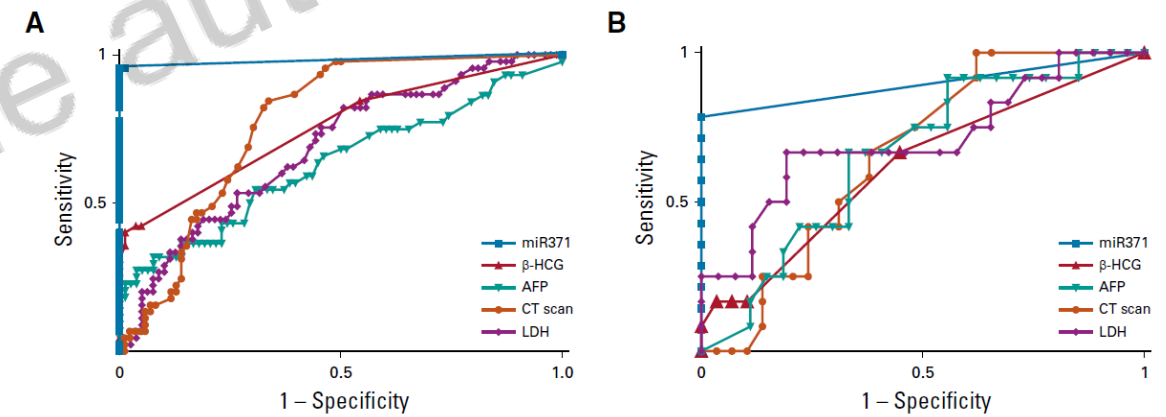

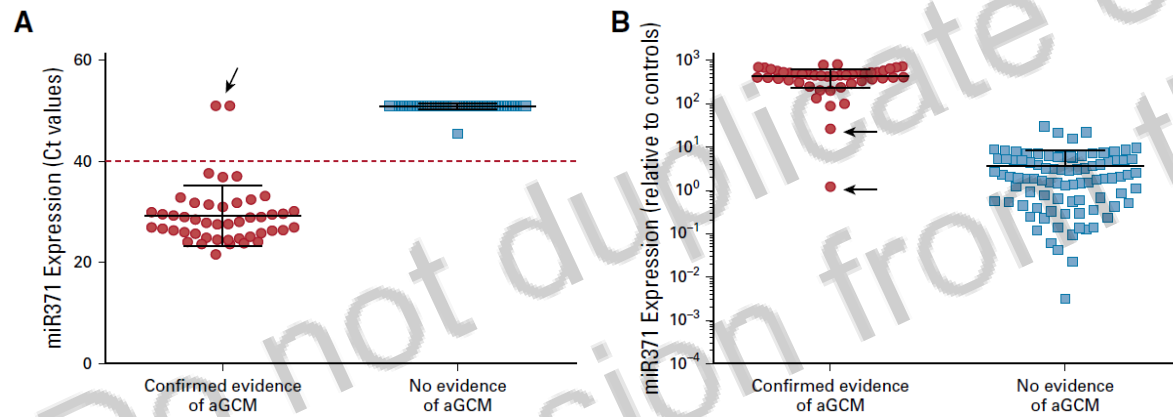

- 90 patients (1993-2000)
- ~ **1.5-3% late relapses, up to 72% diagnosis with symptoms**, up to 40% markers or imaging
- Median FU: 3.02 years (from relapse)
- 20/83 chemo-naïve
- **43/49 CR with surgery**
- **6/32 CR with chemotherapy (4 chemo-naïve)**
- late relapses should be managed **primarily with surgery** (if feasible), **salvage chemotherapy is generally ineffective**
- **follow-up over 5 years** or patient education on signs / symptoms?

|           | Chemo-naïve Seminoma<br>N=26 | Chemo-exposed Seminoma<br>N=3 | Chemo-naïve NSGCT<br>N=22 | Chemo-exposed NSGCT<br>N=39 |
|-----------|------------------------------|-------------------------------|---------------------------|-----------------------------|
| 2-5 years | 22 (84.6%)                   | 3 (100%)                      | 18 (81.8%)                | 18 (46.1%)                  |
| >5 years  | 4 (15.4%)                    | 0                             | 4 (18.1%)                 | 21 (53.8%)                  |

# Early identification of relapse: novel biomarkers

- **miRNA-371** is expressed in plasma of patients with clear evidence of active germ cell malignancy (aGCM)
- **ROC curves** show the high specificity and positive predictive value of miRNA 371 and confirm it **overperforms** compared to **CT imaging** and **serum tumour markers**

# Long-term effects of treatments

| Type   | Causes  | Effects   | References  |

# Non-testicular cancer (TC) mortality

- **23-40% excess non-TC mortality** vs general population (1975 onward) related to cisplatin-based Cht (**PBCT**) and **RT  $\geq 20$  Gy**, not after surgery
- **Younger survivors  $< 20$  years**, 2.27-fold significantly increased risk
- **Cumulative mortality of 9.6% 25 years after treatment**

## Causes of non-TC mortality:

- **Secondary malignancies:** most important (43% excess after PBCT, 59% after RT), likely not significant after Carboplatin
- **Cardiovascular disease: within the first year** (60% excess mortality, 2.1-fold risk of IHD mortality after PBCT)
- **Suicide risk 20% increase** 1.65-fold excess after PBCT
- **Others: infections/surgery, genitourinary diseases/PBCT, digestive diseases/RT**

# Long-term effects of treatments: genetic susceptibility

- Germline mutations associated with cisplatin-related:
- **Pulmonary toxicity (BLMH)**
- **Neuropathy (GSTP1 and RPRD1B)**
- **Ototoxicity (megalin, COMT, TPMT, and ACYP2);**
- **Hearing loss (WFS1)**
- **Tinnitus (OTOS)**

**Table 1.** Genetic susceptibility to the late complications of treatment in testicular cancer survivors (TCSs): an overview\*

| First author, year (ref.) | Population   | Study design  | Treatment regimen(s)   | Endpoint           | Genetic marker (gene) <sup>†</sup> | Major findings  |
|---------------------------|--|---|--|--------------------|------------------------------------|---|
| Oldenburg, 2007 (139)     | Norwegian TCS treated 1980–1994 (n = 238)  | Retrospective cross-sectional; long-term toxicities assessed via Scale for Chemotherapy-Induced Neurotoxicity, 1998–2002                        | BEP, 44%; CVB, 44%; 100% exposed to cisplatin-based therapy (median cum. dose = 397 mg/m <sup>2</sup> ); 95% exposed to bleomycin (median cum. dose = 145 mg/m <sup>2</sup> )  | Neurotoxicity      | Glutathione S-transferase (GSTP1)  | <i>GSTP1</i> genotype G-G vs A-G or A-A: finger paresthesias (OR = 0.46, 95% CI = 0.22 to 0.96), toe paresthesias (OR = 0.42, 95% CI = 0.20 to 0.88), and for tinnitus (OR = 0.33, 95% CI = 0.14 to 0.74)   |
| Oldenburg, 2007 (140)     | Norwegian TCS treated 1980–1994 (n = 173)  | Retrospective cross-sectional; hearing impairment assessed with audiometric testing, 1998–2001  | BEP, 44%; CVB, 44%; 100% given cisplatin-based therapy (median cum. dose = 397 mg/m <sup>2</sup> ); 95% given bleomycin (median cum. dose = 145 mg/m <sup>2</sup> )  | Ototoxicity        | Glutathione S-transferase (GSTP1)  | <i>GSTP1</i> genotype A-A vs G-G: hearing impairment (OR = 3.82, 95% CI = 1.12 to 13.98). <i>GSTP1</i> genotype A-A vs A-G: hearing impairment (OR = 4.25, 95% CI = 1.26 to 14.38)  |
| Nuver, 2005 (136)         | Consecutive nonseminomatous TC patients treated at University Hospital Groningen, the Netherlands, 1977–2003 (n = 340) | Retrospective cohort; data on bleomycin-induced pulmonary toxicity derived from medical records   | All patients received bleomycin-containing regimen (median cum. dose = 270 mg)   | Pulmonary toxicity | Bleomycin hydrolase (BLMH)         | <i>BLMH</i> genotype not associated with either development of BIP or changes in pulmonary function tests   |
| de Haas, 2008 (141)       | See Nuver, 2005 (136) (subset, n = 304)  | Retrospective cohort; data on vital status, last follow-up date, and cause of death derived from medical records and general practitioner files | All patients received a bleomycin- and platinum-containing regimen (median bleomycin cum. dose by genotype: 270 mg [A/A], 270 mg [A/G], and 360 mg [G/G]; median cisplatin cum. dose by genotype: 400 mg/m <sup>2</sup> [A/A], 400 mg/m <sup>2</sup> [A/G], and 400 mg/m <sup>2</sup> [G/G]) | Overall survival   | Bleomycin hydrolase (BLMH)         | <i>BLMH</i> SNP A1450G had a statistically significant effect on TC-related survival (for G-G vs A-A, HR = 4.97, 95% CI = 2.17 to 11.39) and on early relapse (16% with a genotype of G-G relapsed at <2 y vs 9% with A-A who relapsed at <2 y; <i>P</i> = .19) |

Travis et al *J Natl Cancer Inst* 2010  
Fung et al *J Natl Compr Canc Netw* 2019

# Long-term effects of treatments: genetic susceptibility

- **However:**
  - Data still **not validated** for clinical use
  - **Expensive tests** and need of **specialised labs**
  - Often not eventually helpful due to the **necessity of treatments** to guarantee the cure rate

Table 1 (continued).

| First author, year (ref.) | Population  | Study design   | Treatment regimen(s)  | Endpoint    | Genetic marker (gene) <sup>†</sup>         | Major findings   |
|---------------------------|---|--|---|-------------|--|--|
| Peters, 2000 (142)        | German patients with testicular germ cell tumor, osteosarcoma, neuroblastoma, and brain tumor; diagnosed 1991–1996 (n = 20 with ototoxicity, n = 19 without hearing loss) | Nested case-control; hearing impairment assessed via audiogram | 100% given cisplatin-based therapy; (median cum. dose = 429 mg/m <sup>2</sup> in group with ototoxicity; 422 mg/m <sup>2</sup> in group without hearing loss) | Ototoxicity | Glutathione S-transferase ( <i>GSTM3</i> ) | <i>GSTM3</i> *B allele was protective for ototoxicity; allele frequency (0.025 in ototoxicity group vs 0.18 in group with normal hearing) ( $\chi^2 = 5.37$ ; $P = .02$ )  |
| Peters, 2003 (143)        | See Peters, 2000 (142)  | See Peters, 2000 (142)   | See Peters, 2000 (142)  | Ototoxicity | Mitochondrial DNA sequence variations      | Haplotype J (defined by a <i>Nla</i> III site gain at position 4216 and by site losses at positions 13704 <i>Bst</i> NI and 16065 <i>Hinf</i> I) frequency in ototoxicity group was 0.25 vs 0.05 in group with normal hearing ( $\chi^2 = 2.9$ ; $P = .08$ )     |
| Riedemann, 2008 (144)     | See Peters, 2000 (142); 50 additional patients (25 with ototoxicity, 25 without hearing loss)   | See Peters, 2000 (142)   | 100% given cisplatin-based therapy (mean cum. dose = 425 mg/m <sup>2</sup> in group with ototoxicity and 434 mg/m <sup>2</sup> in group without hearing loss) | Ototoxicity | Megalin ( <i>LRP2</i> )                    | rs4668123 was not associated with genotype and ototoxicity; rs2075252 had an A-allele frequency in the ototoxicity group of 0.32 vs an A-allele frequency in group with normal hearing of 0.14 ( $\chi^2 = 5.83$ ; $P < .02$ ; OR = 3.45, 95% CI = 1.11 to 11.2) |

\* BEP, bleomycin, etoposide, and cisplatin; BIP, bleomycin-induced pneumonitis; CI = confidence interval; cum. = cumulative; CVB, cisplatin, vinblastine, and bleomycin; HR = hazard ratio; OR = odds ratio; ref. = reference; SNP = single-nucleotide polymorphism; TC, testicular cancer.

<sup>†</sup> Entrez Gene identification is in parenthesis.

# Surveillance and Follow-up: definition

- **No standard definition**, often considered as interchangeable, but some Authors suggest:
  - **Surveillance** is intended to reach an **early diagnosis of relapse**, with the term **active** indicating an alternative option to treatment.
  - **Follow-up** aims at detecting **medium- and long-term consequences** of treatment
- So far, there is **no strong evidence** supporting the **modalities** and **timing** of **examinations** useful for these two clinical aspects but some **practical guidelines**, besides specific active surveillance protocols for stage I, have been reported over the latest decades (other than NCCN, EAU and ESMO guidelines) considering different **risk factors**, **radiological examination type** and **timing**, **follow-up intensity** and **duration**

*Beyer et al Ann Oncol 2013*

*Banna et al Cr Rev Oncol Haematol 2019*

*Chovanec et al Nat Rev Urol 2016*

# UK guidelines for the follow-up: seminoma

- **Seven scenarios by stages and treatments**
- **Seminoma stage I active surveillance:**
  - **n.5 CT scans:** every 6m for 2ys, then yearly for 5ys

## Note:

- **CT scans of abdomen only** (unless pelvis at high risk)
- **CXR** instead of CT
- After 5y: yearly until **10 years**, clinical and markers
- **Late effects** assessed at 2, 5 and 10 years

### (\*) Late effects

Clinical examination including blood pressure measurement, height and weight

Urea + electrolytes, fasting cholesterol (HDL and LDL), triglycerides, fasting glucose

Hormone profile (FSH, LH and testosterone)

### Seminoma: Stage 1. Surveillance

Markers: AFP,  $\beta$ HCG and LDH

CT scans of abdomen only unless pelvis at high risk  
Late effects should be assessed at 2, 5 and 10 years (see Late effects box)\*

| CT      |   |   |   |   |   |   |   |   |   |    |    | x  |

Discharge after 5 years

- Advise not smoking and paying attention to their body weight
- Especially after 5 years of follow-up investigate suspicions of heart and/or kidney disease
- Advise all nationwide developed screening programs

# UK guidelines for the follow-up: seminoma

- **Seminoma stage I single-agent carboplatin:**
  - **n.3 CT scans:** years 1, 2 and 5
- **Seminoma stage IIa/b carboplatin/radiotherapy:**
  - **n.4 CT scans:** 2 year 1, 1 year 2, 1 year 5
- For both:
  - **CT scan of abdomen only** (unless pelvis at high risk)
  - **CXR** instead of CT
  - After 5y: yearly until **10 years**, clinical and markers
  - **Late effects** assessed at **2, 5 and 10 years**

## Seminoma: Stage 1. Single-agent carboplatin

Markers: AFP,  $\beta$ HCG and LDH

CT of abdomen only unless pelvis at high risk  
Late effects should be assessed at 2, 5 and 10 years (see Late effects box)\*

# UK guidelines for the follow-up: non-seminoma

- **Non-seminoma & seminoma stage IIc-III post-ChT:**

- **n.1 CT scan (after CR): year 5**

- **Note:**

- **CT scan of abdomen only** (unless pelvis at high risk)
- **CXR instead of CT**
- **Seminoma complete at 5ys**
- **Non-seminoma** continue up to **10ys** with yearly CXR, then biannually without CXR
- **Late effects** assessed at **2, 5 and 10 years**

NSGCT and seminoma: Stages IIc-IV. Post chemotherapy

Markers: AFP,  $\beta$ HCG and LDH

CT until CR with or without surgery, frequency determined by MDT

Late effects should be assessed at 2,5 and 10 years (See Late effects box)\*

# Active surveillance for clinical stage I non-seminoma: Danish guidelines

- **n.4 CT scans** but **frequent serum tumour markers**
- 30.6% relapse at 5 years: **50% if VI+** vs 12% without
- Most of **early relapses** (80% with 1st year) detected by **increased markers**, late relapses by CT scan
- **94.4%** relapses **IGCCCG good prognosis**
- **Late relapses** after 5 years: **0.5%**

**Table 4.** Suggestion for a Follow-Up Program for Patients With Stage I NSGCC

| Program Element                      | Month |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------------------------------|-------|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|
|                                      | 1     | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 15 | 18 | 21 | 24 | 30 | 36 | 42 | 48 | 54 | 60 |
| CT scan                              |       |   |   | x |   |   |   | x |   |    |    | x  |    |    |    |    |    | x  |    |    |    | x  |

| Physical examination                 |       | x |   | x |   | x |   | x |   | x  |    | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  |
| Free and total testosterone, LH, FSH |       | x |   |   |   |   |   |   |   |    |    | x  |    |    |    | x  |    |    |    |    |    | x  |

Abbreviations: CT, computed tomography; FSH, follicle-stimulating hormone; LH, luteinizing hormone; NSGCC, nonseminoma germ cell cancer.

# Active surveillance for clinical stage I disease: Canadian guidelines

- **n.6 CT scans for non-seminoma and n.7 for seminoma, but less frequent serum tumour markers**
- Relapse: 19% non-seminoma, 13% seminoma
- Most relapse within 2/3 years (90% non-seminoma and 92% seminoma)
- Mostly detected by **CT scan** vs STM in **seminoma** (87/3%), but **similarly or better by STM depending on VI in non-seminoma**: 48/38% in VI(-) and 41/61% in VI(+)
- **90% non-seminoma and 99% seminoma relapses IGCCCG good prognosis**

**Table 4.** Authors' Recommendations for Surveillance Schedules Based on the Observed Patterns of Relapse and the Authors' Expert Opinion

| Year              | Frequency (months)   |               |             |                 |
|-------------------|----------------------|---------------|-------------|-----------------|

# Stage I Seminoma – 5-year surveillance and follow-up

## Note:

- **Risk-adapted:**
  - **H - High-risk** patients (15-30% risk of relapse): tumor size ( $\geq 4$  cm) and / or invasion of the rete testis, no adjuvant therapy
  - **L - Low-risk** (5%): no risk factors, or any adjuvant therapy
- Use of **abdomen-pelvis MRI without contrast** (instead of abdomen-pelvis CT with contrast), **US** only when CT or MRI not foreseen
- **2 abdomen imaging alone in low risk x 5 years**
- **Metabolism** including andrology every 2-3 years
- **Psychological counseling:** at least once at the beginning and in case of signs of psychosocial distress and / or a reduction in the perceived quality of life during the follow-up

Table 1

5-year surveillance and follow-up for the stage I Seminoma.

| Month   | 6th    | 12th   |
|---|--------|--------|
| <b>1 st year</b>  |        |        |
| Physical examination and markers (AFP, bHCG e LDH)                        | all    | all    |
| Abdominal imaging (CT with contrast or MRI without contrast) <sup>a</sup> | only H | all    |
| Testicular ultrasound   | –      | all    |
| <b>2nd Year</b>   |        |        |
| Physical examination and markers (AFP, bHCG e LDH)                        | all    | all    |
| Abdominal imaging (CT with contrast or MRI without contrast) <sup>a</sup> | only H | all    |
| Testicular ultrasound   | –      | all    |
| FSH, LH, testosterone   | –      | all    |
| <b>3rd year</b>   |        |        |
| Physical examination and markers (AFP, bHCG e LDH)                        | all    | all    |
| Abdominal imaging (CT with contrast or MRI without contrast) <sup>a</sup> | –      | only H |
| Testicular ultrasound   | –      | all    |
| <b>4th year</b>   |        |        |
| Physical examination and markers (AFP, bHCG e LDH)                        | all    | all    |
| Abdominal imaging (CT with contrast or MRI without contrast) <sup>a</sup> | –      | only H |
| Testicular ultrasound   | –      | all    |
| <b>5th year</b>   |        |        |
| Physical examination and markers (AFP, bHCG e LDH)                        | all    | all    |
| Abdominal imaging (CT with contrast or MRI without contrast) <sup>a</sup> | –      | only H |
| Testicular ultrasound   | –      | all    |
| FSH, LH, testosterone   | –      | all    |
| <b>Other:</b>   |        |        |
| Psychological <sup>b</sup>  | –      | –      |
| Metabolism <sup>c</sup>   | –      | –      |
| Visits <sup>d</sup>   | –      | –      |

<sup>a</sup> Ultrasound only when a CT or MRI is not foreseen.

<sup>b</sup> In all cases, at least once at the beginning of follow-up and in cases presenting symptoms of psychosocial distress and/or reduction of perceived quality of life during the follow-up.

<sup>c</sup> Including blood lipids, glucose, creatinine, vitamin D, FSH, LH, testosterone, BMI and blood pressure: every 2–3 years in the first 5–10 years, after 10 years on the basis of personal anamnesis.

<sup>d</sup> Including andrology, internal medicine, cardiology, nephrology, ORL (+/- audiometric tests), pneumological (+/- respiratory tests) consulting: if symptoms, clinical or laboratory abnormalities, risk factors including PEB for 3–4 cycles and/or radiotherapy, desire of paternity (andrology and semen analysis).

# Stage I Non-seminoma: 5-year surveillance and follow-up

## Note:

- **Risk-adapted:**
  - **H - High-risk patients** (50% risk of relapse): presence of VI, no adjuvant therapy;
  - **I - Intermediate risk** (15%): absence of VI invasion, no adjuvant therapy;
  - **L - Low-risk** (<5%): after treatment with #1 PEB (or RPLND).
- Use of **abdomen-pelvis MRI without contrast** (instead of abdomen-pelvis CT with contrast), better **CXR** of chest CT, US only when CT or MRI not foreseen
- **Max 8 CT / MRI abdomen-pelvis** with contrast in high-risk x 5 years
- **Psychological counseling:** at least once at the beginning of the follow-up and in case of signs of psychosocial distress and / or a reduction in the perceived quality of life during the follow-up.

**Table 2**  
5-year surveillance and follow-up for the stage I Nonseminoma.

| Month   | 4th    | 6th      | 8th    | 12th     |
|---|--------|----------|--------|----------|
| <b>1 st Year</b>  |        |          |        |          |
| Physical examination and markers (AFP, bHCG e LDH)  | all    | –        | all    | all      |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray better than CT) imaging | only H | only I-L | only H | all      |
| Testicular ultrasound   | –      | –        | –      | all      |
| <b>2nd Year</b>   |        |          |        |          |

| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray better than CT) imaging | –      | all      | –      | only H-I |
| Testicular ultrasound   | –      | –        | –      | all      |
| FSH, LH, testosterone   | –      | –        | –      | all      |
| <b>3rd Year</b>   |        |          |        |          |
| Physical examination and markers (AFP, bHCG e LDH)  | –      | all      | –      | all      |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray better than CT) imaging | –      | only H   | –      | only H-I |
| Testicular ultrasound   | –      | –        | –      | all      |
| <b>4th Year</b>   |        |          |        |          |
| Physical examination and markers (AFP, bHCG e LDH)  | –      | all      | –      | all      |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray better than CT) imaging | –      | –        | –      | only H   |
| Testicular ultrasound   | –      | –        | –      | all      |
| <b>5th Year</b>   |        |          |        |          |
| Physical examination and markers (AFP, bHCG e LDH)  | –      | all      | –      | all      |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray better than CT) imaging | –      | –        | –      | only H   |
| Testicular ultrasound   | –      | –        | –      | all      |
| FSH, LH, testosterone   | –      | –        | –      | all      |
| <b>Other:</b>   |        |          |        |          |
| Psychological <sup>b</sup>  | –      | –        | –      | –        |
| Metabolism <sup>c</sup>   | –      | –        | –      | –        |
| Visits <sup>d</sup>   | –      | –        | –      | –        |

Abbreviations: CT, computed tomography; MRI, magnetic resonance imaging; PEB, cisplatin, etoposide, bleomycin.

<sup>a</sup> Ultrasound only when a CT or MRI is not foreseen.

<sup>b</sup> At least once at the beginning of follow-up and in cases presenting symptoms of psychosocial distress and/or reduction of perceived quality of life during the follow-up.

<sup>c</sup> Including blood lipids, glucose, creatinine, vitamin D, FSH, LH, testosterone, BMI and blood pressure: every 2–3 years in the first 5–10 years, after 10 years on the basis of personal anamnesis.

<sup>d</sup> Including andrology, internal medicine, cardiology, nephrology, ORL (+/- audiometric tests), pneumological (+/- respiratory tests) consulting: if symptoms, clinical or laboratory abnormalities, risk factors including PEB for 3–4 cycles and/or radiotherapy, desire of paternity (andrology and semen analysis).

# Advanced disease in remission after treatment: 5-year surveillance and follow-up

Note:

- **Risk adapted:**
- **H - High-risk patients** (> 45% risk of relapse/progression): "poor-risk" according to the IGCCCG classification at the first line of treatment or relapsed / refractory not "very low risk" according to IPFSG (95% of patients)
- **I - Intermediate risk** (25-30%): "intermediate-risk" according to the IGCCCG classification at the first line of treatment or relapsed / refractory "very low risk" according to IPFSG;
- **L - Low-risk patients** (<15%): "good-risk" according to the IGCCCG classification at the first line of treatment.
- **Use of abdomen-pelvis MRI without contrast** instead of abdomen-pelvis CT with contrast and better **chest x-ray** or **low-dose CT** or contrast CT

**Table 3**  
5-year surveillance and follow-up for the advanced disease in remission after treatment.

| Month  | 4th    | 6th      | 8th    | 12th |
|--|--------|----------|--------|------|
| <b>1 st Year</b>   |        |          |        |      |
| Physical examination and markers (AFP, bHCG e LDH)   | only H | all      | only H | all  |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray or low-dose CT or CT with contrast) <sup>b</sup> and other imaging examinations based on the sites of advanced disease | only H | only I-L | only H | all  |
| Testicular ultrasound  | -      | -        | -      | all  |
| <b>2nd Year</b>  |        |          |        |      |
| Physical examination and markers (AFP, bHCG e LDH)   | only H | all      | only H | all  |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray or low-dose CT or CT with contrast) <sup>b</sup> and other imaging examinations based on the sites of advanced disease | only H | only I-L | only H | all  |
| Testicular ultrasound  | -      | -        | -      | all  |
| FSH, LH, testosterone  | -      | -        | -      | all  |
| <b>3rd Year</b>  |        |          |        |      |
| Physical examination and markers (AFP, bHCG e LDH)   | -      | all      | -      | all  |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray or low-dose CT or CT with contrast) <sup>b</sup> and other imaging examinations based on the sites of advanced disease | -      | only H-I | -      | all  |
| Testicular ultrasound  | -      | -        | -      | all  |
| <b>4th Year</b>  |        |          |        |      |
| Physical examination and markers (AFP, bHCG e LDH)   | -      | all      | -      | all  |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray or low-dose CT or CT with contrast) <sup>b</sup> and other imaging examinations based on the sites of advanced disease | -      | only H-I | -      | all  |
| Testicular ultrasound  | -      | -        | -      | all  |
| <b>5th Year</b>  |        |          |        |      |
| Physical examination and markers (AFP, bHCG e LDH)   | -      | all      | -      | all  |
| Abdominal (CT with contrast or MRI without contrast) <sup>a</sup> and thoracic (X-ray or low-dose CT or CT with contrast) <sup>b</sup> and other imaging examinations based on the sites of advanced disease | -      | only H-I | -      | all  |
| Testicular ultrasound  | -      | -        | -      | all  |
| FSH, LH, testosterone  | -      | -        | -      | all  |
| <b>Other:</b>  |        |          |        |      |
| Psychological <sup>c</sup>   | -      | -        | -      | -    |
| Metabolism <sup>d</sup>  | -      | -        | -      | -    |
| Visits <sup>e</sup>  | -      | -        | -      | -    |

<sup>a</sup> Ultrasound only when a CT or MRI is not foreseen.

<sup>b</sup> If a risk of thoracic relapse is estimated (i.e. > 5%).

<sup>c</sup> In all cases, at least once at the beginning of follow-up and in cases presenting symptoms of psychosocial distress and/or reduction of perceived quality of life during the follow-up.

<sup>d</sup> Including blood lipids, glucose, creatinine, vitamin D, FSH, LH, testosterone, BMI and blood pressure: every 2-3 years in the first 5-10 years, after 10 years on the basis of personal anamnesis.

<sup>e</sup> Including andrology, internal medicine, cardiology, nephrology, ORL (+/- audiometric tests), pneumological (+/- respiratory tests) consulting: if symptoms, clinical or laboratory abnormalities, risk factors including PEB for 3-4 cycles and/or radiotherapy, desire of paternity (andrology and semen analysis).

# Radiological imaging

- **Ph-3-R TRISST study in stage I seminoma:** non-inferiority for both comparisons i.e. **imaging frequency** (7 vs 3) and modality (MRI vs. CT). **MRI should be recommended**
- **Abdominopelvic US** might be preferred **after 3 years of FU**
- Use of **low-dose CT:** device type and imaging protocols to be periodically updated
- Low-dose **model-based iterative reconstruction:** 67% reduction in Rx dose
- **Contralateral testis US:** 3-4% risk at 15 years

## TRISST

Trial of Imaging and Schedule in Seminoma Testis

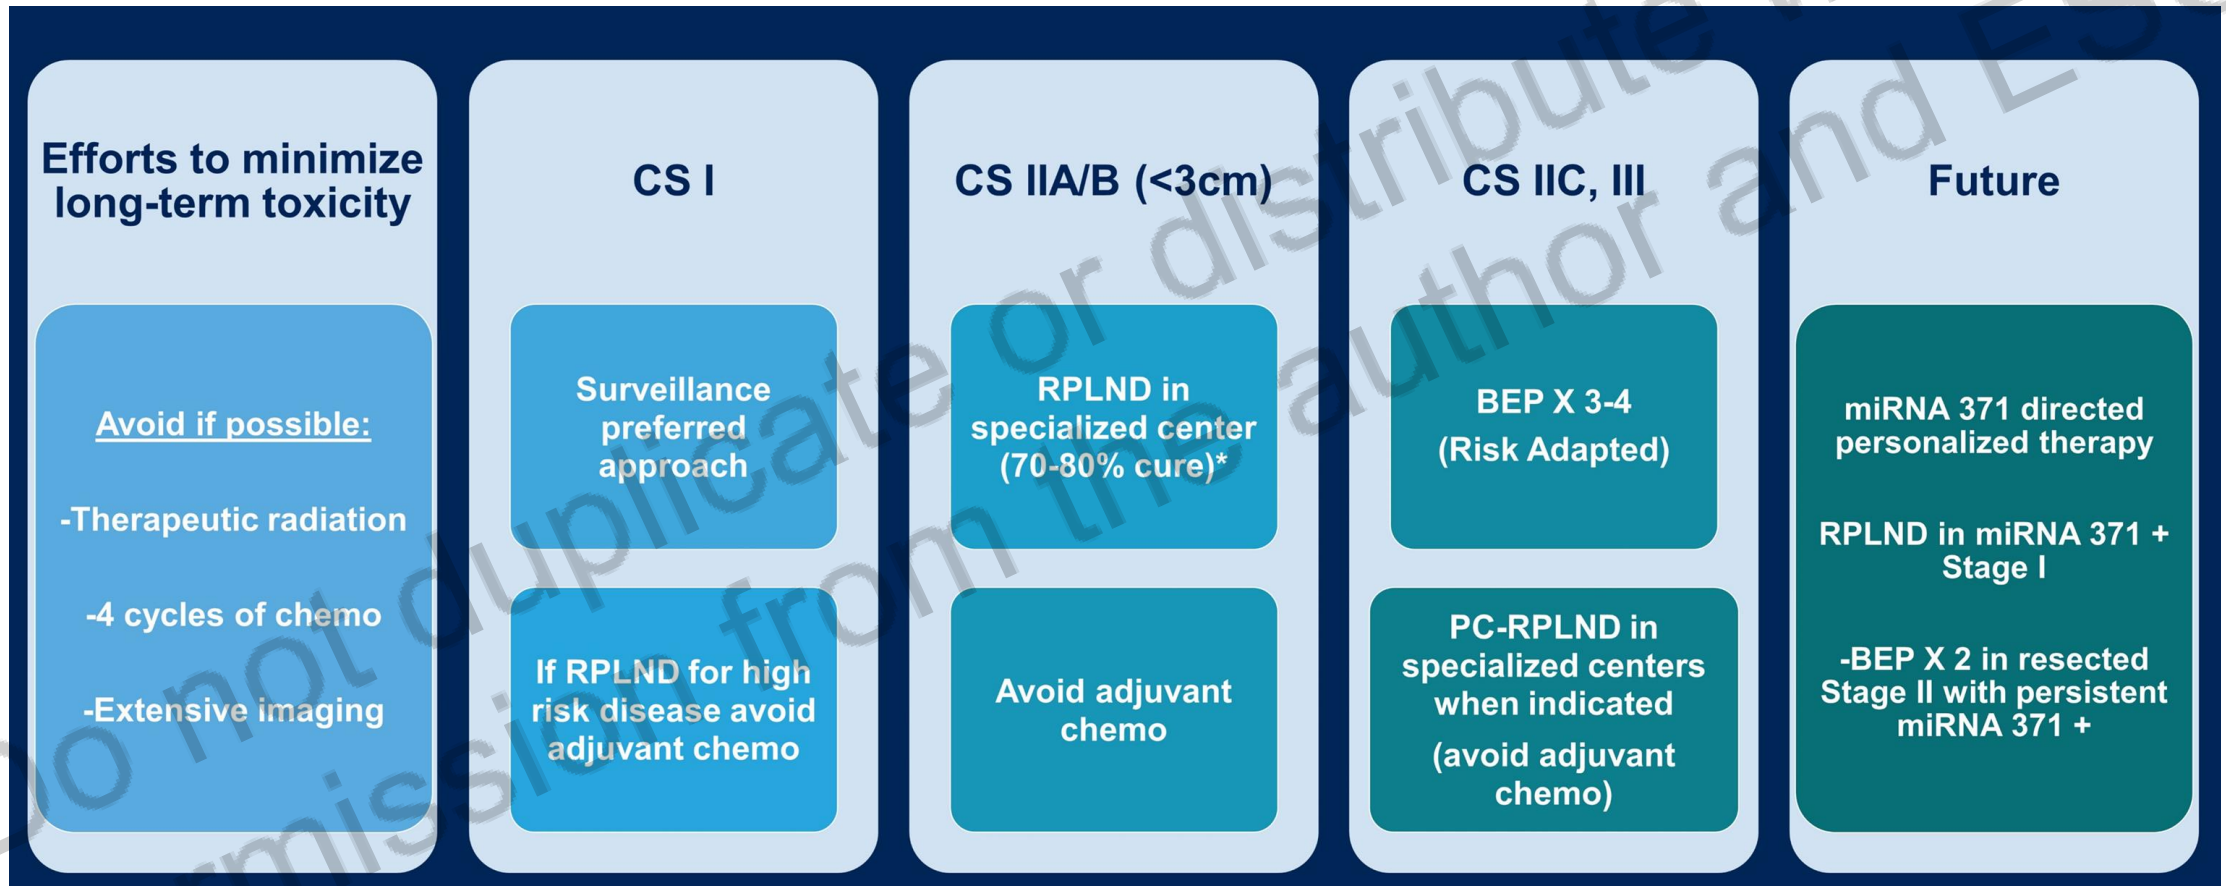

# Management of treatment-related complications

- Aim to **reduce treatment burden**
- Administer **intense hydration** with **cisplatin**
- Assess/monitor **pulmonary function** (bleomycin)
- Discuss **sperm cryopreservation**
- Implement effective **coping strategies**
- Monitor **hormonal status** (replace testosterone)
- Advise to adhere to **national screening guidelines**
- Counsel about **CVD risk-factor modification**
- Avoid **smoking, sympathomimetic, ototoxic drugs**
- Prescribe **duloxetine** for **pain management**

| eTable 1. Recommended Management Options for Treatment-Related Complications |  |
|--|--|
| Treatment-Related Complications  | Recommended Management   |
| Second malignant neoplasms   | <ul style="list-style-type: none"> <li>• Healthcare providers should advise TCS to adhere to national cancer screening guidelines applicable to the general population<sup>6</sup></li> <li>• Every effort should be made to reduce the amount of cytotoxic exposure needed to successfully treat the cancer</li> </ul>  |
| CVD  | <ul style="list-style-type: none"> <li>• No established evidence-based CVD screening recommendations exist specifically for TCS</li> <li>• Healthcare providers should counsel TCS about CVD risk-factor modification, advising adherence to guidelines<sup>7</sup> for the general population</li> </ul>  |
| Raynaud phenomenon   | <ul style="list-style-type: none"> <li>• Raynaud phenomenon-associated symptoms can be prevented by avoidance of cold and other aggravating factors, including smoking, sympathomimetic drugs, and selected treatments for either attention-deficit/hyperactivity disorder or migraine headaches<sup>8</sup></li> </ul>  |
| Ototoxicity  | <ul style="list-style-type: none"> <li>• Although there are no effective pharmacotherapies to prevent or treat cisplatin-related ototoxicity, TCS should minimize noise exposure and avoid other ototoxic agents.</li> </ul>   |
| Neurotoxicity  | <ul style="list-style-type: none"> <li>• ASCO clinical practice guidelines for CIPN<sup>9</sup> recommend duloxetine for management of pain, because there are no effective agents available to prevent or treat CIPN</li> </ul>   |
| Nephrotoxicity   | <ul style="list-style-type: none"> <li>• During cisplatin-based chemotherapy, healthcare providers should avoid nephrotoxic drugs<sup>10</sup> and administer intense hydration<sup>11</sup> to minimize the degree of renal damage</li> </ul>   |
| Pulmonary toxicity   | <ul style="list-style-type: none"> <li>• Before initiation of any bleomycin-containing chemotherapy regimen, healthcare providers should perform a detailed patient history, including consideration of age, smoking status, and preexisting lung disease, and consider baseline pulmonary function</li> <li>• Healthcare providers should also withhold bleomycin at the earliest clinical signs or symptoms of bleomycin-induced pulmonary toxicities during chemotherapy</li> </ul> |
| Hypogonadism   | <ul style="list-style-type: none"> <li>• Healthcare providers should routinely evaluate TCS for hypogonadism symptoms and assess hormonal status accordingly</li> <li>• Decisions to administer testosterone replacement therapy should be based on clinical symptoms of hypogonadism, and referrals to endocrinologists should be considered for challenging cases<sup>10</sup></li> </ul>  |
| Infertility  | <ul style="list-style-type: none"> <li>• The ASCO clinical practice guideline for fertility preservation<sup>12</sup> recommends referral of patients with cancer to appropriate reproductive specialists if clinically indicated; sperm cryopreservation remains a standard fertility preservation practice before treatment initiation for interested patients with TC</li> </ul>  |
| Cognitive impairment   | <ul style="list-style-type: none"> <li>• Because subjective cognitive complaints may reflect the effects of underlying anxiety and depression that are prevalent in TCS,<sup>13</sup> implementation of effective coping strategies should be considered</li> </ul>  |
| Chronic CRT  | <ul style="list-style-type: none"> <li>• Exercise and psychologic interventions should be considered</li> </ul>  |

Abbreviations: CIPN, chemotherapy-induced peripheral neuropathy; CRT, cancer-related fatigue; CVD, cardiovascular disease; TC, testicular cancer; TCS, testicular cancer survivors.

# Possible improvements in the general management of patients with testicular cancer

# Lesson from the SARS-CoV2 pandemic

## ESMO recommendations<sup>1</sup>:

- given the high cure rate with oncological treatments, even in advanced disease, and being GCTs prevalent in the young population, the indication for curative oncological treatment should be guaranteed and priority unless relevant comorbidities

## Survey of 3 cooperative groups (Italian, European and Canadian) during the pandemic<sup>2</sup>:

- **preference for surveillance in stages I;**
- **bleomycin should not be omitted** (i.e., 3 PEB cycles better than 4 EP cycles);
- surgery or radiotherapy (where indicated) must not be delayed (also for residue);
- G-CSF recommended as primary PEB prophylaxis during the pandemic

<sup>1</sup>ESMO guidelines during COVID-19 pandemic. Available at <https://www.esmo.org/guidelines/cancer-patient-management-during-the-covid-19-pandemic>

<sup>2</sup>Nappi et al The Oncologist 2020

# Take-home messages

- Follow-up and surveillance for testicular cancer start with **careful assessment, appropriate treatment and counselling**
- **Evidence** on modalities and timing of examinations is **limited but** following **clinical recommendations** would result in **optimising risk-benefit ratios** for **individual patients**, while **ensuring economic use of resources**
- **Open issues: length of follow-up and surveillance, examinations** (clinical, instrumental and lab), **professionals** to be involved
- **Precision-medicine approaches** with **novel biomarkers** (like miRNA-371) and **genetic variants** (i.e. germline mutations) will likely help to **reduce treatment burden, develop risk-based, targeted prevention and intervention** through the identification of testicular cancer (risk) and acute or long-term adverse events
- A **longitudinal cohort study following survivors** for life to examine **morbidity and latency trends** of late adverse outcomes according to treatment types is needed

Thanks!

#TeniamoceliStretti
